PIMSY Performance Brought to a Whole New Level with the Power of Voice!!

Documenting patient encounters can seem overwhelming, especially when there is little time between patient visits. Meanwhile, documentation requirements keep increasing. Speech-Recognition software is one tool that can save you time. This is particularly true with a cloud based solution that allows for maximum flexibility. Utilizing the appropriate tools to minimize time spent documenting will, in turn, help to maximize time spent with your client.

Learn how Speech Recognition Software can help you:

- 1) Navigate PIMSY– Rather than pointing and clicking, automate many of the time-consuming tasks associated with electronic documentation by creating voice enabled shortcuts. Open and close a patient chart, navigate to specific tabs, order medications and complete forms. All with your voice.
- 2) Tell your client's story – Dictate directly into an EMR in real-time. With the recent focus placed on documenting discrete data, let's not forget how important it is to document your observations and capture the important elements of a narrative. Spoken words can be converted to text within seconds – typically 3x the speed of typing.
- 3) Improve accuracy and efficiency – Streamline documentation requirements with templates and macros that are available to be used on virtually any device. Understand the true benefits of cloud computing with the ability to access your individual profile while at the clinic, at home or on the road.

[SayIt from nVog](#), used with PIMSY EHR, can give mental health providers back the time needed to make the best treatment decisions, and allow them to **focus on the patient, not the computer.**
