

Are Your Mobile Devices HIPAA-Compliant?

Okay, so we've told you about encryption on computers, but what about mobile devices like iPads, iPhones and Androids? Can you encrypt these so that PHI on them is not accessible by anyone but you? The answer is yes and it is actually quite simple in most cases.

Encryption on Apple Devices

- According to TechTarget, [Their team] "found the Apple iOS to be more secure, in part because iOS has very limited multitasking functions. It has more security features than Android or Windows at this time."
- Turning on an iPad's passcode feature automatically encrypts all the data stored on the device. The device will prevent access to the passcode if the wrong one is entered 10 times consecutively.
- The iPad can encrypt messages through the Advanced Settings Option under Account Information.
- The iPad's built-in email client supports encrypted email transfers over the Secure Sockets Layer (SSL) protocol. To turn on SSL, go to the Advanced Settings option under Account Information. This will not encrypt email while it is on your iPad, but it will encrypt emails sent over the internet between your iPad and your email server.

PIMSY Has Empowered Us

"I LOVE how the notes are connected to the billing. It keeps the counselors accountable to get their notes done.

The longer we have PIMSY, the more we like it. PIMSY has empowered us to do things I didn't even know were possible!"{Ann O., Clinical Director}

Clinician Toolbox

Do you use EMDR in your practice? Eye Movement Desensitization and Reprocessing (EMDR) is an integrative psychotherapy approach that has been extensively researched and proven effective for the treatment of trauma.

EMDR is a set of standardized protocols that incorporates elements from many different treatment approaches. See more [here...](#)

To your success!
